portion.

- 4. (amended) A method for avoiding overflow of a decoder buffer [containing a portion of new data stream and a portion of an old data stream,] comprising:
 - (a) determining a total amount of old data stream data that, if transmitted to said decoder buffer, would occupy said decoder buffer;
 - (b) adding, to said total amount, an amount of new data stream data to obtain a combined amount of data;
 - (c) testing if said combined amount of data would overflow said decoder buffer; and
- 8 (d) if overflow would occur, then causing a portion of the new data stream to be delayed by
 9 a delay amount corresponding to at least said overflow, if said portion were to be transmitted to said
 10 decoder buffer.
- 5. (amended) A method according to claim 4, wherein [said] the step (a) of determining is preceded by determining a maximum size of said decoder buffer;
- 1 8. (amended) A method according to claim 4, further comprising:
- prior to testing of step (c), subtracting, from said total amount, an amount of old data stream
 data that, if transmitted, would be decoded by [said] a decoder;
- 9. (amended) A method according to claim 4, wherein said delay amount of step (d) is a function of
- an amount of data stream data by which said decoder buffer is overflowed within said portion of the
- 3 new data stream.
- 1 10. (amended) A method according to claim 4, wherein said delay amount of step (d) is a function of
- 2 an amount of data stream data by which said decoder buffer is overflowed in a single instance of
- 3 overflow within said portion of the new data stream.
- 1 16. (amended) A method for detecting overflow of a data stream decoder during splicing of data
- 2 stream portions including an old data stream portion and a new data stream portion, comprising:

" A Do

22. (amended) A method [according to claim 20, wherein said] comprising:

determining a delay [is] caused by re-scheduling transmission of [said portion] a part of new

- data stream data in a new data stream portion during splicing of data stream portions including an old
- data stream portion and the new data stream portion according to a formula:

Amendment Gazit -- Ser. No. 09/055,156 November 1, 2000 Page 3

R	_	
P11 6	5	(currently scheduled transmission time for said portion) + ((n packets x m bits/packet x
8	6	multiplexer bit rate) / (data stream bit rate)),
	7	wherein n indicates a number of packets by which transmission is to be delayed, and m indicates a
	8	number of bits in a packet of data stream data to be transmitted.
	1	27. (amended) A method according to claim 24, wherein determining said modified new data stream
	2	timing reference includes:
	3	(i) determining a program clock reference of a first packet of said new data stream;
	4	(ii) determining a delay between transmission of a first sequence header of said new data
	5	stream and a first decode time stamp [("]DTS[")] of a first frame of said new data stream;
	6	(iii) determining a continuous DTS as a sum of said first DTS and an inter-frame delay; and
	7	(iv) determining a new data stream real-time transmit time as said continuous DTS of step (iii)
	8	minus said delay of step (ii)
	1	28. (amended) A method according to claim 24, wherein said aligning in step (b) sets a start time for
	2	transmitting [a] the portion of the new data stream that corresponds with a decoding time for
	3	decoding [a] the portion of the old data stream.
	1	29. (amended) A method according to claim 24, wherein said aligning in step (b) sets a start time for
	2	a decoder buffer to begin receiving [a] the portion of the new data stream that corresponds with a
	3	decoding time for decoding [a] the portion of the old data stream.
		Ţ
	1	31. (amended) A method according to claim 24, wherein said determining of step (a) is preceded by
	2	(i) determining [a] the splice-out point of the old data stream; and
	3	(ii) determining [a] the splice-in point of the new data stream.
	1	33. (amended) A method according to claim 32, wherein said frame type is selected from a group
	2	consisting of B-frames and P-frames, and wherein said step of modifying comprises closing an open
	3	group of pictures [("]GOP[")].

- (b) assigning a splice-buffer for storing [an] the portion of the old data stream [portion] and a new data stream portion;
 - (c) directing the old data stream portion to said splice-buffer;
 - (d) determining said splice-out point;
 - (e) directing the new data stream portion to said splice-buffer;
- (f) determining a splice-in point within the new data stream portion and, if an initial frame of the new data stream portion is dependent upon a frame that precedes the new data stream portion, then modifying the new data stream portion to remove said dependency;
- (g) if, upon transmission, a decoder buffer would begin to receive the new data stream after said buffer finally receives [a] the portion of the old data stream, then aligning the new data stream with [said finally receiving] the finally received portion of the old data stream, and
- (h) if, upon transmission, a decoder buffer would begin to receive the new data stream before said buffer finally receives [a] the portion of the old data stream, then aligning the new data stream with [said finally receiving] the finally received portion of the old data stream and modifying the portion of the old data stream.
- 52. (amended) Amethod according to claim 51, wherein said dependency of step (f) is an open GOP and wherein said modifying closes the open [group of pictures ("]GOP[")].
- 53. (amended) A method according to claim 51, further comprising:
 - [(i)] checking for overflow of said decoder buffer; and
- [(k)] if overflow is found, then removing said overflow.
- 54. (amended) A splicer for splicing digitally encoded data streams, including an old data stream and a new data stream, comprising:
- (a) means for determining, in accordance with a splice-out point of an old data stream and a splice-in point of a new data stream, a new data stream real-time transmit start time; and
- (b) means for aligning the new data stream with the old data stream according to said new data stream real-time transmit time, said means for aligning both delaying and accelerating said new data stream when splicing said old data stream and said new data stream.

Amendment

55. (amended) A method for preparing a digitally encoded data stream for splicing, comprising: (a) determining a splice-in point of [the] a new data stream; and (b) closing an initial open group of pictures [("]GOP[")] of the new data stream, if the new data stream includes an initial open GOP. 56. (amended) A splicer for splicing digitally encoded data streams including an old data stream and a 1 new data stream, comprising 2 (a) means for determining a splice-in point of the new data stream; and 3 (b) means for closing an open group of pictures [("]GOP[")] of the new data stream, if the 4 new data stream includes [an] the open GOP. 5 58. (amended) A method according to claim 57, wherein [a] said splice-out point is determined as 1 being immediately prior to a sequence header. 2 59. (amended) A method according to claim 57, wherein [a] said splice-out point is determined as 1 being immediately prior to a first occurring one of a group of pictures [("]GOP[")] header, an I-frame 2 and a P-frame. 3 60. (amended) A method according to claim 51, wherein said step of determining [a] said splice-in 1 point comprises: 2 finding a decode time stamp ("DTS") for a frame of the new data stream, said frame being 3 included within a group of pictures [("]GOP[")] of the new data stream; 4 finding a corresponding presentation time stamp for said frame of the new data stream; and 5 if said frame of the new data stream is other than an I-frame, then closing said GOP. 6

BIN CIO

1

64. (amended) A method according to claim 63, wherein step (b) is accomplished by deleting another frame within said portion that precedes said independently decodable frame.

61. (amended) A method according to claim 60, wherein said frame is [an] the initial frame of the

new data stream.

65. (amended) A method for closing an open group of pictures GOP of a digitally encoded data

- stream, said GOP including a plurality of frames, comprising:
 - (a) determining a first I-frame within said GOP;
 - (b) determining, within said GOP, a largest decode time stamp DTS of all of said frames that precede said I-frame;
 - (c) deleting all frames within said GOP that precede said I-frame;
 - (d) modifying temporal references for at least one remaining frame within said GOP; and
 - (e) replacing a DTS of said I-frame with said largest DTS of step (b).

67. CANCEL

- 68. (amended) A method for aligning a splice-out portion of a digitally encoded old data stream with 1
- a splice-in portion of a digitally encoded new data stream comprising the step of finding a new data 2
 - stream real-time transmit time [according to claim 67] wherein said step of finding includes:
 - (a) determining a program clock reference ("PCR") of a first packet of said new data stream;
 - (b) determining a delta-period between transmission of a first sequence header of said new data stream and a first decode time stamp ("DTS") of a first frame of said new data stream, if said new data stream is transmitted;
 - (c) determining a continuous DTS as a sum of said first DTS and an inter-frame delay; and
 - (d) determining said new data stream real-time transmit time as a difference between said continuous DTS and said delta-period.
- 71. (amended) A method for aligning a splice-out portion of a digitally encoded old data stream with 1
- a splice-in portion of a digitally encoded new data stream, comprising the step of setting a start of 2
- 3 receipt time of said new data stream at which, if said new data stream is transmitted, then said new
- data stream will begin to be received by a decoder in alignment with a decoding time for said splice-4
- out portion of said old data stream, and wherein said step of setting includes: 5
- if said new data stream, upon transmission, would begin to be received by the decoder after 6
- the decoder has received all of said splice-out portion, then setting a transmission acceleration 7
- parameter for said new data stream. 8

14

15

72. A method according to claim 71 wherein said step of setting includes:

2 if, upon transmission of said old and new data streams, said new data stream would begin to

be received by a decoder before the decoder would have received all of said splice-out portion, then

setting a transmission delay parameter for said new data stream.

69

74. (amended) A method according to claim 73 wherein said number of null packets equals a number

of data packets that, without [said] inserting the null packets, would be received by [a] the decoder

before the decoder has received all of said splice-out portion, if the new data stream is transmitted.

75. CANCEL

- 1 77. (amended) A method according to claim 76 wherein said number of null packets equals a number
- of data packets that, without said deleting, would be received by [a] the decoder after the decoder has
 - received all of said splice-out portion, if the new data stream is transmitted.

- 78. (amended) A method for aligning a splice-out portion of a digitally encoded old data stream with
- a splice-in portion of a digitally encoded new data stream, said splice-out portion and said splice-in
 - portion each comprising a plurality of packets, which comprises:
 - (a) parsing said splice-out portion for a program clock reference ("PCR") of a last packet of said splice-out portion to be transmitted;
 - (b) parsing said splice-in portion for a first sequence header and a first decode time stamp ("DTS") of a first frame of said new data stream;
 - (c) determining a [continuous DTS] real-time transmit time of said new data stream;
 - (d) if the splice-out PCR of step (a) is less than the real-time transmit time of step (c), then storing a value indicating a total number of null packets which, when transmitted prior to said splice-in portion, will cause transmission of said splice-in portion to begin at substantially a same time as decoding of said splice-out portion; and
 - (e) if said splice-out portion PCR of step (a) is greater than said real-time transmit time of step (c), then storing a total number of null packets which, when deleted from said splice-in portion, will approximate a condition in which the splice-out portion PCR equals the real-time transmit time.
